

OUTPUTS

1. Write a query to retrieve the names and salaries of employees from each department who earn more than ₹50,000. Use the index on department_id and salary to optimize the performance.

Result Grid			
Filter Rows:			
	department_id	employee_name	salary
▶	1	Employee A	60000.00
	1	Employee B	65000.00
	2	Employee C	70000.00
	2	Employee E	80000.00
	3	Employee D	75000.00
	3	Employee F	85000.00

2. Find the most recently ordered product by each customer

Result Grid				
Filter Rows:				
Export:				
	customer_id	customer_name	product_name	order_date
▶	1	Customer A	Product 5	2023-08-12
	2	Customer B	Product 2	2023-08-15
	3	Customer C	Product 1	2023-09-20

3. Find the most frequently ordered product by each customer? Note: most frequently ordered means the highest volume ordered.

Result Grid			
Filter Rows:			
	customer_id	product_id	product_name
▶	1	1	Product 1
	1	2	Product 2
	1	3	Product 3
	1	5	Product 5
	2	2	Product 2
	2	3	Product 3
	2	4	Product 4
	3	1	Product 1
	3	5	Product 5
	3	6	Product 6

4. List the names of suppliers who supply products in 'Category 2'. (try using join and subquery separately)

Result Grid			Filter Rows:
	supplier_name	supplier_id	
▶	Supplier A	1	
	Supplier B	2	

5. List the employees who are working on more than one project.

Result Grid			Filter R
	employee_id	Project	
▶	1	2	
	2	2	
	4	2	

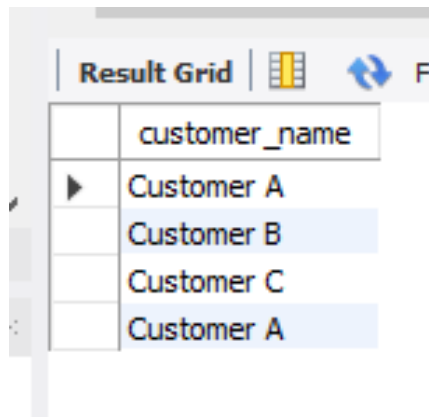

6. Display the customer name along with number of orders and total amount paid

Result Grid				Filter Rows:
	customer_name	no_of_order	total_amount	
▶	Customer A	4	600.00	
	Customer B	3	500.00	
	Customer C	3	550.00	

7. List the top 3 products that have generated the highest revenue.

Result Grid			Filter Rows:
	product_name	highest_revenu	
▶	Product 1	5000.00	
	Product 2	2500.00	
	Product 3	4250.00	

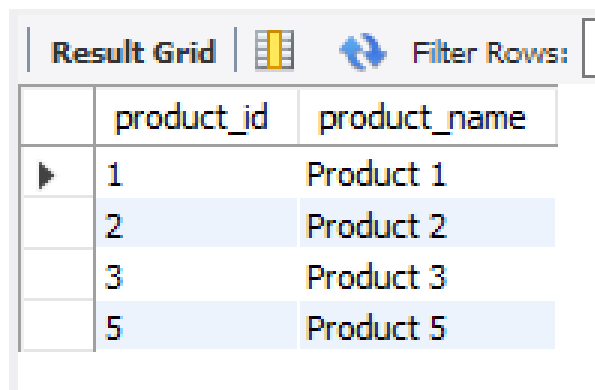

8. List customers who have ordered every product supplied by 'Supplier B'.

The screenshot shows a 'Result Grid' with a single column titled 'customer_name'. It contains four rows of data: 'Customer A', 'Customer B', 'Customer C', and 'Customer A'. The second and fourth rows are highlighted in blue.

customer_name
Customer A
Customer B
Customer C
Customer A

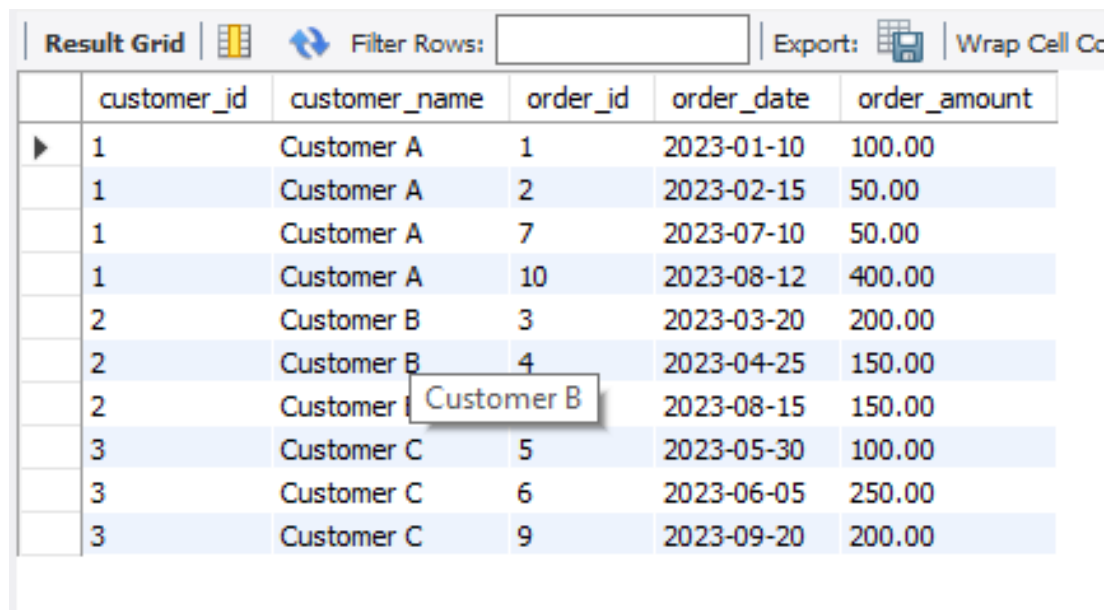

9. Find the products ordered by at least two different customers.

The screenshot shows a 'Result Grid' with two columns: 'product_id' and 'product_name'. It contains four rows of data: (1, Product 1), (2, Product 2), (3, Product 3), and (5, Product 5). The second and fourth rows are highlighted in blue.

product_id	product_name
1	Product 1
2	Product 2
3	Product 3
5	Product 5

10. Write a query to list all customers and their orders. If a customer has not placed any order, show their name with NULL for order details.

The screenshot shows a 'Result Grid' with six columns: 'customer_id', 'customer_name', 'order_id', 'order_date', and 'order_amount'. It contains ten rows of data. The first four rows are for Customer A (orders 1, 2, 7, 10), the next three for Customer B (orders 3, 4, 5), and the last three for Customer C (orders 6, 9, 10). The second and fourth rows are highlighted in blue. A tooltip is visible over the 'Customer B' text in the third row.

customer_id	customer_name	order_id	order_date	order_amount
1	Customer A	1	2023-01-10	100.00
1	Customer A	2	2023-02-15	50.00
1	Customer A	7	2023-07-10	50.00
1	Customer A	10	2023-08-12	400.00
2	Customer B	3	2023-03-20	200.00
2	Customer B	4	2023-04-25	150.00
2	Customer B	5	2023-08-15	150.00
3	Customer C	6	2023-05-30	100.00
3	Customer C	9	2023-06-05	250.00
3	Customer C	10	2023-09-20	200.00

11. Write a query to find the total order amount for each product (based on product_id) and show it along with the product name. Include orders even if the product no longer exists in the products table.

Result Grid			 Filter Rows:	<input type="text"/>	Export:	
	product_id	product_name	total_orders	total_revenue		
	5	Product 5	2	500.00		
	1	Product 1	2	300.00		
	3	Product 3	2	250.00		
	6	Product 6	1	250.00		
	2	Product 2	2	200.00		
	4	Product 4	1	150.00
